Guided Exercises

Part 1: Perform a Vulnerability Scan with Nmap

6. Make a screen capture showing nmap results indicating that anonymous FTP is enabled for one of the hosts in the network.

17. **Record** whether each IP address has port 445 open or closed and whether it is also vulnerable to an SMB vulnerability.

172.30.0.2- 445/tcp open, smb-vuln-ms10-054: False, smb-vuln-ms10-061: Access denied

172.30.0.3- 445/tcp open, smb-vuln-ms10-054: False, smb-vuln-ms10-061: Access denied, smb-vuln-ms17-010: VULNERABLE to CVE-2017-0143

172.30.0.5- 445/tcp closed

172.30.0.4- 445/tcp closed

Part 2: Perform a Vulnerability Scan with the GVM Framework

15. Make a screen capture showing the first page of detected vulnerabilities in the Greenbone Security Assistant.

The screenshot shows the Greenbone Security Assistant (GSA) interface in a web browser. The browser's address bar displays the URL `https://127.0.0.1:9392/results`. The GSA interface has a green header with the logo and a navigation menu. The main content area displays a table of detected vulnerabilities. The table has columns for Vulnerability, Severity, QoD, Host IP, Name, Location, and Created. The first two rows show 'Microsoft Windows SMB Server Multiple Vulnerabilities-Remote (4013389)' with a severity of 9.3 (High) and a QoD of 95%. The table is sorted by severity in descending order. At the bottom of the interface, there is a footer with copyright information and a message about the Iceweasel browser.

It looks like you haven't started Iceweasel in a while. Do you want to clean it up for a fresh, like-new experience? And by the way, welcome back!

Refresh Iceweasel...

Part 3: Document Vulnerabilities with SimpleRisk

24. Make a screen capture showing the **submitted SMB remote code execution risk**, including the **Inherent and Residual Risk values**.
