MCY 620 Data Privacy: PET Hands On Work

Task 1

Visual Privacy Education Game

<https://kaleabtesfaye01.github.io/VisualPrivacyApp/>

I chose the Visual Privacy Education Game as a PET because it raises awareness about the visual privacy hazards associated with sharing facial photos online. This interactive, cryptography based program employs game style scenarios to assist users in identifying and mitigating privacy issues while adhering to key privacy principles. It improves problem solving skills and encourages practical solutions for safeguarding personal information in both digital and physical environments.

Task 2

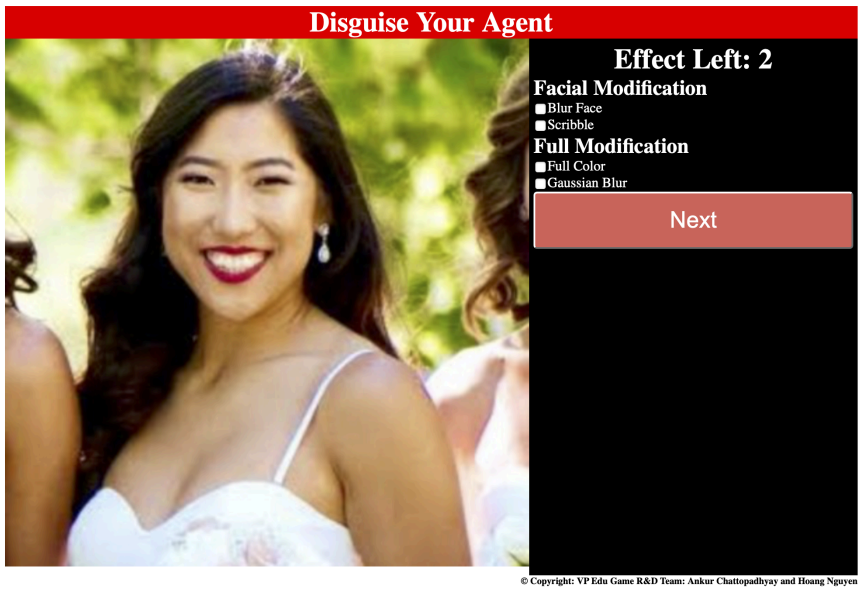

I worked through simulated scenarios to better understand the privacy dangers connected with visual breaches and the significance of adopting safeguards. I logged my choices with screenshots, noting how quickly I could recognize a chosen face with only one undo option. To test the method, I chose a specific individual, masked the photo with a blur face and scribble , and encrypted it with the password "love." After entering the password, the personal information was effectively revealed. The game replicates privacy issues, keeping the player engaged while emphasizing how sensitive information might be revealed to unauthorized parties.

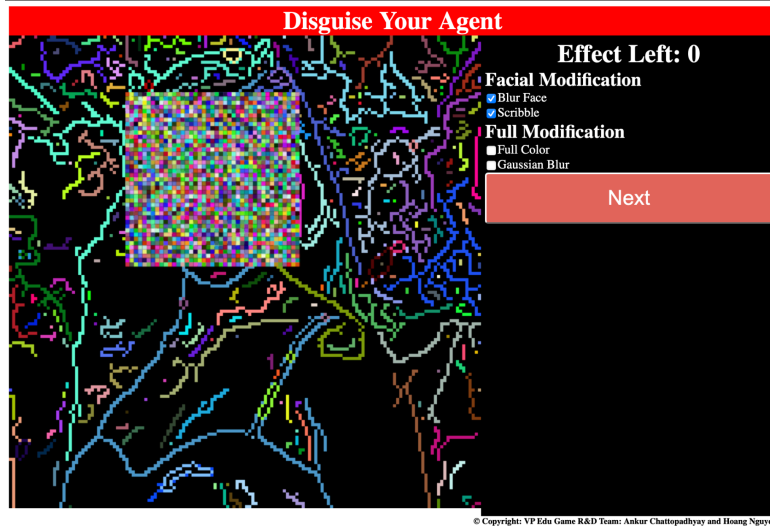

The background of the slide is a dark world map. Overlaid on the map are several glowing circles in various colors (blue, green, orange, purple) and small red dots, suggesting a global network or data points.

Encryption

Do you want to encrypt your modification

Yes

No

Cryptography is the art of protecting information by transforming it into an unreadable format, called cipher text. Only those who possess a secret key can decipher the message into plain text. Encrypted messages can sometimes be broken by cryptanalysis, also called codebreaking, although modern cryptography techniques are virtually unbreakable.

Task 1

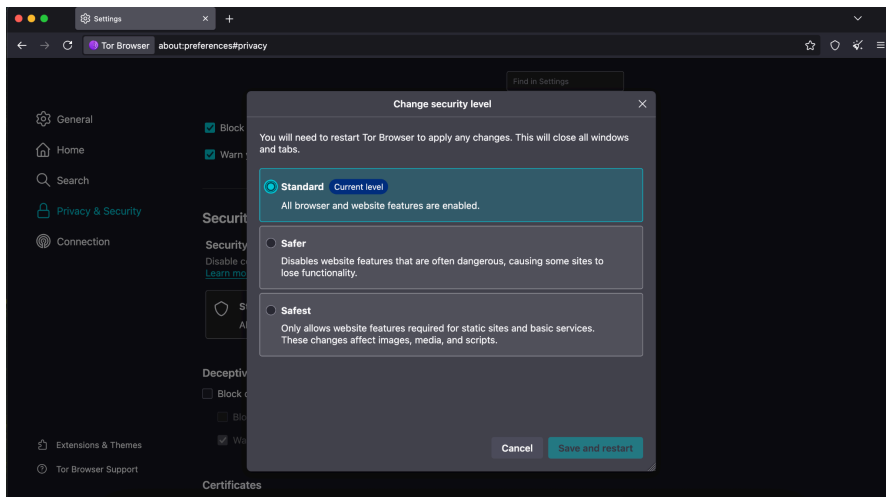

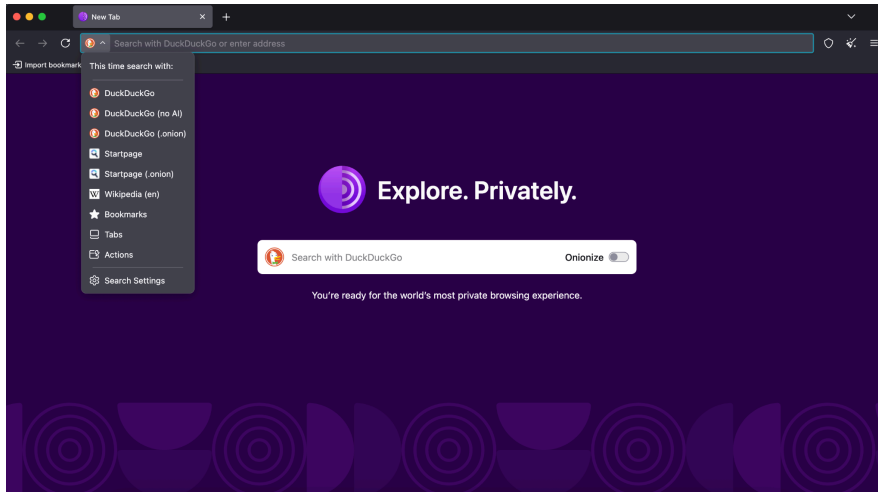

Tor Browser

<https://www.torproject.org/download/>

The Tor Browser is a privacy-focused web browser that uses the Tor network to encrypt data and hide users' IP addresses, enhancing anonymity and privacy online. This technology protects users against monitoring, tracking, and censorship, making it a must have for online privacy. I choose the Tor Browser for its ability to protect online privacy and anonymity while avoiding digital surveillance.

Task 2

I saw how the Tor network is used to anonymize user identities when browsing different websites. I gathered screenshots along the investigation to record the process of accessing various websites while maintaining anonymity and privacy. I studied the browsers onion service capabilities, which improve user privacy. Onion services are often used for privacy focused websites, including whistleblower platforms, forums, and communication channels. I analyzed the browser design and settings to let users change their privacy options and maximize their web browsing experience. The hands on examination demonstrated the Tor Browsers efficiency in safeguarding users online privacy.

HTTPS-Only Mode

Only allows secure connections to websites. Tor Browser will ask before connecting insecurely.

[How HTTPS-Only works](#)

- ☒ Enable HTTPS-Only Mode in all windows
- ☐ Enable HTTPS-Only Mode in private windows only
- ☐ Don't enable HTTPS-Only Mode
Tor Browser may still upgrade some connections [Learn more](#)

Task 1

Anonymous Camera

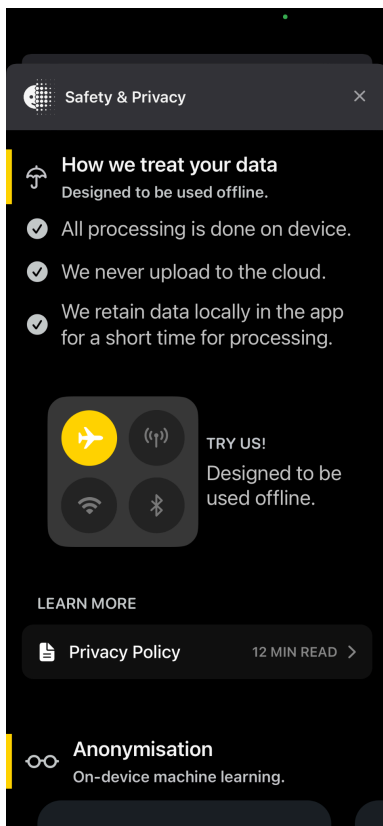

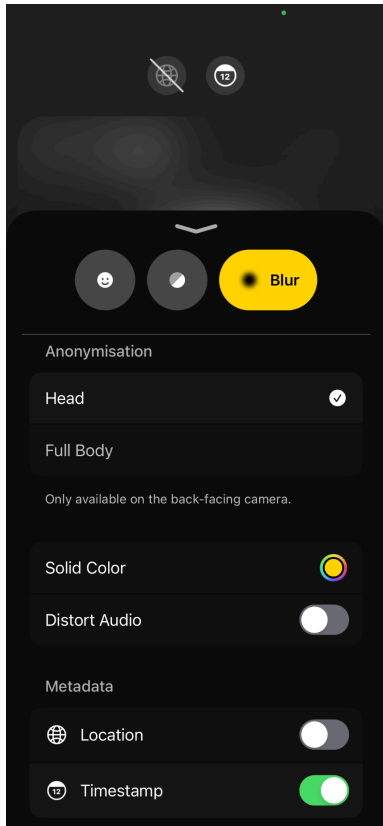

<https://apps.apple.com/us/app/anonymous-camera/id1504102584>

Protecting personal information, particularly images, is crucial, and this application improves privacy by functioning without a server, which means it does not retain users personal data. Users do not need to register an account after installing the program, which increases security. All collected data is anonymised and used exclusively in aggregate to improve the service. The program lets users obscure faces or complete bodies in photographs and videos, provides real time anonymization, and eliminates location and timestamp metadata to safeguard their identity. I chose it as a PET because it protects privacy and anonymity while addressing the increasing usage of face recognition as a biometric identification mechanism in current mobile operating systems and applications.

Task 2

I successfully installed the application on an iOS device after locating and downloading it from the apple mobile app store. I browsed application features for various settings and privacy parameters. Tested out the masking by taking photos with the blur setting applied. To boost anonymity, the software employs machine learning to blur or mask faces and bodies in real time, as well as speech distortion and the elimination of location and timestamp details. This is a powerful and publicly available PET with useful security features.

Task 1

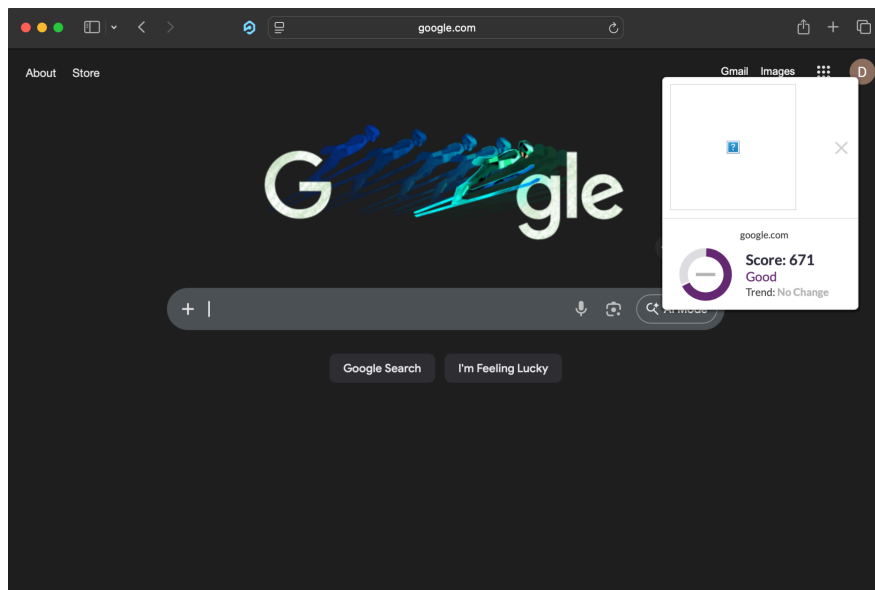

Privacy Monitor by Osano

<https://www.privacymonitor.com/score/>

This website and browser extension checks websites for privacy policies, terms and conditions, and other fine print before generating a dynamic "privacy score" that changes when policies change.

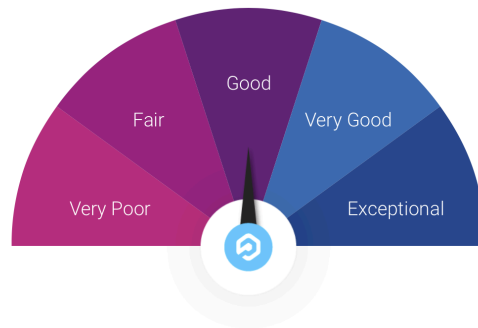

Task 2

I successfully located and installed the extension from the landing page onto my Safari web browser. The extension shows the score in the browser and connects to a complete report at [privacymonitor.com](https://www.privacymonitor.com). It offers a versatile and cost effective solution for enterprises and security experts to assess privacy policies, discover gaps, and proactively enhance data protection tactics.

Privacy Score Ranges

(click to see how a score affects your privacy)

Score Range
670 - 739

Impact on your Privacy

Sites rated as Good are generally good citizens of the Internet who may engage in some data sharing but usually with your opt-out consent.

Their definition of consent may be less rigorous than more highly rated sites. While these sites have a generally good score, exercise caution before sharing sensitive information.

How We Calculate Privacy Scores

1

Our attorneys research & analyze the fine print that a web site publishes. Then they answer more than 150 questions about that site.

2

Using the answers to those questions along with a variety of other fact based signals, our systems rank every web site in the database.

3

If a site makes any changes to its policies, our systems automatically see the change, the attorneys review the site again, and the scores are recalculated.
