Lab 4

Answer the following question in your lab report:

What will you see when you click on the button ViewProfile in the last step? Why? (50 points)

Due to me storing an XSS attack within Tom's profile, when I click on ViewProfile I will see the message pop-up injected.

What is the difference between stored XSS and reflected XSS? (50 points)

When a malicious script is injected and kept on a server, it can cause persistent **cross-site scripting attacks (XSS)** that impact several people each time they access the compromised resource, such as a forum post or comment section. However, when a malicious script is inserted in a URL or other input and reflected off the server, it affects only the person who interacts with the infected link. This is known as **reflected XSS (non-persistent XSS)**. While reflected XSS usually attacks a single user at a time, stored XSS has a more widespread effect.
